Introduction

This document is intended for WAY4 administrators (WAY4 Customer Support staff, bank or processing centre employees).

When working with this document, it is recommended to use the following resources from the OpenWay documentation series:

- "Documents".
- "POS Network Management"

The following notation is used in the document:

- Field names in screen forms are shown in *italics*.
- Key combinations are given in angular brackets, as in <Ctrl>+<F3>.
- Button labels in screen forms and on tabs are enclosed in square brackets, for example [OK].
- Names of commands and links in tabs are enclosed in curly brackets, as in {Create}.
- Sequences for making a selection from a user or context menu are shown with arrows in the following way: "Financial Core → Configuration → Events, States & Classifiers".
- Variable values like directory and file names, as well as file paths that differ for each local computer are enclosed in angular brackets, for example <OWS_HOME>.
- Warnings that there is a danger of causing an error are marked with the  sign.
- Messages marked with the  sign contain information about important features, additional facilities or the optimal use of certain system functions.

Chapter 1. Overview

The particular conditions in which a card transaction was made, for example, device type, PIN entry on a payment terminal PIN pad, reading information from a magnetic stripe are considered by WAY4 when processing transaction information and are recorded as transaction attributes in records (documents) that describe the transaction.

Attributes are split into elementary and group attributes. Group attributes are used if it is not possible to determine (there is no information) or find (no elementary attribute corresponds exactly to transaction conditions) an elementary attribute.

A group attribute can be set when processing a transaction, based on an elementary attribute or on another group attribute. This process is called normalization.

Various transaction condition classifiers can be created using attributes. There are two types of classifier in WAY4:

- static (Transaction Condition - TC).
- dynamic (Group Transaction Condition - GTC).

A static classifier can also be referred to as a main or base classifier.

Any set of attributes can belong to one TC and several GTC.

For each transaction (for which it makes sense to set transaction conditions), a TC or attributes or a TC and attributes must be set.

If attributes are not specified, they will be calculated based on the TC.

If a TC is not specified, it will be calculated on the basis of attributes.

If both a TC and attributes are specified and they contradict each other, warnings may be generated when processing a transaction.

TC characteristics:

- This type of classifier can be used to specify transaction conditions.
- A TC has one fixed standard set of attributes that is used when processing a transaction, if attributes were not specified in the transaction itself.
- For each set of attributes only one TC will be calculated (based on a prioritized set of formulas), if it was not specified in the transaction itself.
- A TC can to a limited extent participate in processing a transaction. This means, for example, that a TC is not used to calculate international payment system indicators (attributes are used to do so, or a fixed standard set of attributes if attributes were not specified) and in Fee Prediction calculation, but can be used in services and risk rules. It is recommended to use a GTC in settings for business rules.

GTC characteristics:

- This type of classifier cannot be used to specify transaction conditions. It represents only part of transaction conditions, grouping them according to several significant properties; for example, "group of PBT transactions",

"group of e-commerce transactions", "group of Contactless transactions", "group of EMV-PBT transactions", etc.

- Several sets of attributes can belong to one GTC (using formulas that are a logical expression from the attributes and GTCs themselves).
- All transaction conditions, i.e. all attributes, cannot be restored according to a GTC,. A GTC can only say which attributes definitely were present and/or which definitely were not present.
- A GTC can to a limited extent participate in processing a transaction (to a greater extent than a TC). It is not used, for example, to calculate international payment system indicators, but can be used in Fee Prediction calculation, services, and risk rules.

The section "Transaction Attributes" shows examples of TC and examples of Transaction Attributes for MasterCard Business Transactions.

When processing a document, this parameter (Transaction Conditions) is used along with other document parameters when searching for a service.

Values for this parameter (Transaction Conditions) are set when creating a document based on data in a transaction message from a device, using the "<Device> Operations" and "Transaction Conditions" system dictionaries (see ""Transaction Conditions" System Dictionary").

 Note that the settings of these dictionaries can only be changed when required by the WAY4 vendor. For example, when custom transaction conditions are created, see "Creating Custom Transaction Condition Dynamic Classifiers".

"Transaction Conditions" System Dictionary

 Note that these settings can only be made when required by the WAY4 vendor.

The main data for the "Transaction Conditions" system dictionary (DB Administrator Utilities → !!! STAFF ONLY !!! → Main Dictionaries → Transaction Conditions) are contained in the following fields:

- *Name* – classifier name (a group classifier name is usually enclosed in angular brackets <>).
- *Code* – classifier code (in particular the base classifier code, used in document processing).
- *Terminal Category* – category of device used for the card transaction.
- *Category Code* – classifier category:
 - "B" – static/main/base classifier of transaction conditions, whose code and corresponding attributes are used as document parameters (*Conditions* and *Condition Details*, see the document "Documents").
 - "G" – dynamic (group) classifier of transaction conditions, whose code is not used as a document parameter.
- *Security Code* – reserved for future use.
- *Addendum* – reserved for future use.

- *Default Conditions* – default classifier of transaction conditions; this value is used when processing a document if the classifier's original value is not specified in any of the Services registered for this transaction type; for example, if Services with TC "Imprinter" and "Pos Card Read" are registered in the Service Package for this transaction type, and the transaction was made with TC "Mail Order Single", the transaction will be processed with the service with TC "Imprinter".
- *Late Conditions* – parameter value used instead of the current one if the document's processing date differs from the transaction date by a value larger than that specified in the Expiry Days field for the corresponding Service; the value of the TC parameter does not change if there is a zero value in the Service's Expiry Days field.
- *Condition Details* – see "Condition Details for TC", "Condition Details for GTC".

If the standard set does not cover a transaction with a certain set of attributes, custom dynamic categories can be created, see "Creating Custom Transaction Condition Dynamic Classifiers".

Condition Details for TC

For base classifiers - TC (Category Code – "B") the *Condition Details* field of the "Transaction Conditions" system dictionary contains a list of standard attributes and the formula for calculating TC according to attributes in the following format:

```
<standard list of attributes>:[<NNNN><formula>]
```

where:

- <standard list of attributes> is a list of attributes. Attributes are listed without commas and spaces. Commas are also placed at the beginning and end of the list.
- <NNNN> - numeric 4-digit TC priority.
- <formula> - logical expression from attributes.

There might not be a priority and formula if TC can be manually specified only, but cannot be assigned based on attributes.

Example with a list and formula:

Code

```
ATMC
```

Condition Details

```
,ATM,CARD_CHIP,READ_CHIP,TERM_CHIP,DATA_CHIP,CARD,CARDHOLDER,PBT,:0130ATM and  
READ_CHIP and not PART_GRADE and not ENET and not RECURRING
```

Example with a list only:

Code

```
PASC
```

Condition Details

```
,POS,BUSN_ADDENDUM,CARD_CHIP,READ_CHIP,TERM_CHIP,DATA_CHIP,CARD,CARDHOLDER,PB  
T,:
```

Condition Details for GTC

For dynamic classifiers - GTC (*Category Code* – "G") the *Condition Details* field of the "Transaction Conditions" dictionary contains criteria for filtering transactions according to the presence or absence of certain attributes or conditions. Example:

- the criterion "(CAT1 and not DATA_CHIP) or (CAT2 and not DATA_CHIP) or (CAT3 and not DATA_CHIP)" will be equal to the criterion "G_CAT_1_2_3 and not DATA_CHIP"
- the criterion "ENET and not (ENET and SECURE_CODE)" will be equal to the criterion "ENET and not SECURE_CODE".

Creating Custom Transaction Condition Dynamic Classifiers

These settings can only be made with the WAY4 vendor's approval.

If the standard set does not cover a transaction with a specific set of attributes, custom dynamic categories can be created.

A dynamic classifier is created with a criterion for the presence or absence of certain attributes and with a code that has the mandatory prefix "G_CUST" (only such settings will not be changed by the WAY4 upgrade process).

Example of a correctly configured dynamic classifier for transaction conditions - GTC:

- *Name* – "<< Custom Ecommerce (3DS) Non-Auth Security Transaction >>"
- *Code* – "G_CUST_ECOM_3DS_NO_SEC_LINE_SEC"
- *Category* – "G"
- *Condition Details*: "ENET and NO_SECURE and LINE_SECURE"

Note that creation of a GTC may cause a drop in system performance if a large number of attributes are specified in the GTC. A reasonable number of attributes is 7.

Creating Custom Transaction Condition Static Classifiers

These settings can only be made with the WAY4 vendor's approval.

Custom static classifiers for transaction conditions have the suffix "C".

Chapter 2. Transaction Attributes

Only the WAY4 vendor may change this dictionary.

The "Transaction Attributes" system dictionary (DB Administrator Utilities → !!! STAFF ONLY !!! → Main Dictionaries → Transaction Attributes) contains data in the following fields:

- Name – transaction attribute name.
- Code – transaction attribute code (see "Overview"). Attribute codes are used when creating transaction condition classifiers (see ""Transaction Conditions" System Dictionary") and custom transaction condition classifiers (see "Creating Custom Transaction Condition Dynamic Classifiers").
- Description – informative description of the attribute. Transaction attributes can be consolidated into 11 sets, according to topic:
 - Authentication (authentication conditions).
 - Card Type (card features).
 - Device Capability (device options).
 - Environment Security (secure access).
 - Input Environment (data source).
 - Input Mode (security conditions).
 - Online/Offline (connection between parties).
 - Parties (presence of parties).
 - Received Data (data and means).
 - Time Constraints (time limits).
 - Transfer Environment (data transfer environment).
 - Business Attributes.

Authentication (authentication conditions)

Topic-based group combines transaction attributes describing conditions for transaction and cardholder authentication.

AUTH_AGENT

Cardholder authenticated by the Issuer's agent.

AUTH_CAD

Cardholder authenticated using Card Acceptance Device (CAD).

AUTH_CARD

Cardholder authenticated by card.

AUTH_MERCH

Cardholder authenticated by merchant.

AUTHENTICATED

Attribute indicates that the cardholder was authenticated (irrespective of whether it was PBT, SBT or another method).

BVF_AUTH

Attribute indicates that the cardholder was authenticated using bio-verification methods (fingerprint scanning, iris scanning, face scanning, voice verification, etc.). Cardholder Authentication Method: bio-verification.

BVF_FINGER_PRINT

Attribute indicates that the cardholder was authenticated using biometric methods of fingerprint identification (Automated Fingerprint Identification System). This attribute can be also specified by the general attribute BVF_AUTH, as it is included in the subset of bio-verification methods.

CVC2

Attribute indicates that CVC2 was used during the cardholder authentication process.

NO_AUTH

Attribute indicates that the cardholder was not authenticated during the transaction.

NO_PIN

Attribute describes the following situation during the transaction: PIN is required, PINpad is available but PIN was not entered.

OTP_AID

Attribute indicates that a one-time password generated by an AID token was used.

OTP_CAP

Attribute indicates authentication based on a one-time password generated by an EMV card pursuant to the MasterCard EMV Chip Authentication Program (CAP).

OTP_DPA

Attribute indicates authentication based on a one-time password generated by an EMV card pursuant to Visa EMV Differential Power Analysis (DPA). The password was generated by a DPA calculator.

OTP_HMAC

Attribute indicates use of HOTP (HMAC-Based One-Time Password Algorithm) — an algorithm for secure authentication using a one-time password (One Time Password, OTP). The password was generated by an OATH token.

OTP_LIST

Attribute indicates that a list of one-time passwords (One Time Password, OTP) was used.

OTP_MMA

Attribute indicates that the MasterCard Mobile Authentication (MMA) standard was used. The password was generated by an MMA calculator.

OTP_SMS

Attribute indicates that a one-time password (One Time Password, OTP) sent by SMS was used.

PASSWORD

Attribute indicates authentication using a static password.

PBT

Transaction was performed in PBT (PIN Based Transaction) mode, i.e. the transaction was performed using any method of providing a PIN .

PBT_CLEAR

PBT mode. PIN is sent clear (unencrypted).

PBT_OFFLINE

PBT mode. PIN is verified offline.

PBT_ONLINE

PBT mode. PIN is verified online, according to a card. The set of AUTH_CARD and PBT attributes describes the attribute.

PIN2

PIN2-based transaction. Cardholder authenticated using PIN2.

PWL_CARD

Authentication using a Password List Card (PWL_CARD).

RECURRING

Recurring Transaction (repeated transaction).

RM_ISS

Transaction authenticated subject to the issuer's risk factor (Risk Based Decision).

RM_MERCH

Merchant made a decision based on its own risk rules.

SBT

Transaction in SBT mode (Signature Based Transaction).

SBT_EL V

SBT mode. Signature is verified using electronic means.

SBT_MAN

SBT mode. Signature is verified manually.

TRANS_AUTH

Transaction has been authenticated.

Card Type (card features)

Topic-based group combines transaction attributes describing the card with which the transaction is made.

CARD_CHIP

Transaction with a chip card (not necessarily by Service Code).

CARD_TRACK

Transaction with a magnetic stripe card.

CHIP_SVC

Transaction with a chip card (defined by Service Code).

Device Capability (device options)

Topic-based group combines attributes specifying the device capabilities used in transaction (for example, the terminal's capability to read data from a smart card).

TERM_BAR

Card Data Input Capability: BAR. Terminal can read BAR code data.

TERM_CHIP

Card Data Input Capability: Chip. Terminal can read chip card data.

TERM_CHIP_CTLS

Card Data Input Capability: Contactless Chip. Terminal can read data using a contactless card reader.

TERM_KEY_ENTRY

Card Data Input Capability: Key Entry. Terminal supports keyboard input of card data.

TERM_OCR

Card Data Input Capability: OCR. Terminal can read data using an optical card reader.

TERM_TRACK

Card Data Input Capability: Magnetic Stripe Data. Terminal can read data from a magnetic stripe.

TERM_TRACK_CTLS

Card Data Input Capability: Contactless Chip. Terminal can read data using a contactless card reader. Contactless communication – track reading (it is likely that the track is located on the card chip).

Environment Security (secure access)

Topic-based group combines attributes indicating secure access to a data source during a transaction.

LINE_INSECURE

Transaction on an insecure channel.

LINE_SECURE

Transaction on a secure channel (for example, through the HTTPS protocol).

NO_SECURE

Transaction without cardholder identification.

SECURE_ATTEMPT

Unsuccessful attempt by the merchant to identify the cardholder.

SECURE_BY_MERCH

Cardholder was identified by the merchant.

SECURE_CODE

Cardholder has been identified.

Input Environment (data source)

Topic-based group combines attributes describing the transaction environment – data source. Data sources are ATMs, POS terminals, kiosks and other devices owned by the merchant or acquirer. Devices owned by the cardholder (mobile phones, card readers connected to a personal computer, etc.) are not data sources in a transaction.

ATM

Attribute indicates that an ATM was used in the transaction. Terminal Type – ATM.

CAT1

Attribute indicates that an automated electronic service device, CAT Level 1 – Automated Dispensing Machine was used in the transaction. Terminal Type – CAT1.

CAT2

Attribute indicates that an automated electronic self-service device, CAT Level 2 – Self-Service Terminal was used in the transaction. Terminal Type – CAT2.

CAT3

Attribute indicates that an automated electronic service device, CAT Level 3 – Limited Amount Terminal was used in the transaction. Terminal Type – CAT3.

CAT4

Attribute indicates that an automated electronic service device, CAT Level 4 – In-Flight Commerce (IFC) Terminal was used in the transaction. Terminal Type – CAT4.

CAT7

Attribute indicates that an automated electronic service device, CAT Level 7 – Transponder Transaction was used in transaction. Terminal Type – CAT7.

IMPRINTER

Attribute indicates that an imprinter was used in the transaction.

MPOS

Attribute indicates that a portable POS terminal was used in the transaction. Terminal Type – m-POS.

NO_TERM

Attribute indicates that no automated electronic service device was used in the transaction. The TERM attribute is an antonym for this attribute.

POS

Attribute indicates that an attended POS terminal was used in the transaction (a specially trained person operates this terminal). Terminal Type – POS.

TBAPPL

Attribute indicates that the transaction was processed using a TeleBank application (mobile banking or web banking application).

TERM

Attribute indicates that an automated electronic service device was used in the transaction. The NO_TERM compound attribute is an antonym for this attribute.

This attribute combines characteristics described by the following attributes: READ_TRACK, **Error! Reference source not found.**, KEY_ENTRY, TERM_CHIP, TERM_TRACK, TERM_KEY_ENTRY, TERM_OCR, TERM_TRACK_CTLIS, TERM_CHIP_CTLIS.

TERM_UNATT

Attribute indicates that the transaction was processed using an unattended terminal (ATM, automated electronic service device).

WALLET

Attribute indicates that the transaction was processed with a Wallet Service Provider.

WEB

Attribute indicates that the transaction was made through a Web browser.

Input Mode (security conditions)

Topic-based group combines attributes describing transaction security conditions.

CONTACTLESS

Transactions initiated through a contactless interface (for example, MasterCard PayPass and VISA Contactless).

READ_CHIP

Data are entered from a chip. Interaction with a chip.

READ_TRACK

Track reading (including track reading from a chip).

Online/Offline (connection between parties)

Topic-based group combines attributes for transaction conditions in the context of the connection between parties. Transaction with or without online authorization.

OFFLINE

Offline transaction. Transaction without contacting an Issuer (or its agent).

ONLINE

Online transaction. Transaction with online interaction between the Acquirer and Issuer (or its agent).

Parties (presence of parties)

Topic-based group combines attributes indicating presence of parties (transaction participants, subjects and objects, for example, card, cardholder, merchant) in a transaction.

CARD

Card is present and participates in the transaction.

CARDHOLDER

Cardholder participates in the transaction.

MERCH

Merchant is a participant in the transaction.

NO_CARD

Card does not participate in the transaction.

NO_CARDHOLDER

Cardholder not present. The cardholder does not participate in the transaction.

NO_MERCH

Merchant not present. The merchant is not a transaction participant. The attribute combines MOTO and TERM_UNATT attributes.

Received Data (data and means)

Topic-based group combines attributes describing the method and means of data transfer, as well as the actual data that were transmitted/received.

DATA_CHIP

Chip data has been transmitted.

DATA_TRACK

Track data has been transmitted.

FAIL_CHIP

Chip data were not transmitted. Terminal failed to read the chip.

FAIL_TRACK

Magnetic stripe data were not transmitted. The terminal failed to read data on the magnetic stripe.

KEY_ENTRY

Manual data input.

KEY_MAP

External system.

PART_GRADE

Acceptance of chip card in a device operating in Partial Guard/Fill Guard mode. The authorization channel sets the attribute.

Attribute indicates that the **Error! Reference source not found.** condition is fulfilled and the DATA_CHIP condition is not fulfilled.

PART_TRACK

Partial track.

REMOTE_CHIP

PAN is entered through a remote chip.

Time Constraints (time limits)

Topic-based group combines attributes describing time limits related to a transaction.

LATE

Late transaction (as compared to standard time frame for such transaction) (obsolete).

Transfer Environment (data transfer environment)

Topic-based group combines attributes describing the data transfer environment in a transaction.

ENET

Electronic transactions initiated through electronic networks (Internet, Mobile Network, etc.).

MAIL

Mail Order. Electronic transactions initiated through e-mail.

MOTO attribute is general for this attribute.

MBSMS

Short Message Service Protocol. Transactions initiated using SMS messages.

MNET

Mobile Network Transaction. Electronic transactions initiated through mobile networks.

MOTO

Transactions without card (Card not present transaction, CNP) in which a card is not physically present in the payment process. Goods are ordered and paid by mail, fax or telephone (Mail Order/Telephone Order (MO/TO)) or over the Internet.

PHONE

Phone Order (or Fax). Transactions without card (Card not present transaction, CNP) in which a card is not physically present in the payment process. Goods are ordered and paid by fax or telephone (Mail Order/Telephone Order (MO/TO)).

MOTO attribute is general for this attribute.

Business Attributes**BUSN_ADDENDUM**

Indicates existence of Business Specific Addenda.

INSTALLMENT

Instalment transaction.

Chapter 3. Examples of Transaction Conditions

The section shows examples of TC and examples of Transaction Attributes for MasterCard Business Transactions. The list provided is not exhaustive.
